Tutorial Proposal

Representative Name of Component: Register Gallery

Functionality and JS event handling:

I am proposing a component that combines functionality of a slideshow gallery, a modal box, and a register form. I will have two of these components on a page, one for ski resorts in Eastern United States and one for ski resorts in Western United States. It would show the images in a gallery like in the picture below.

When one of smaller pictures in the bottom row is clicked, there will be JS event handling that changes the larger display picture to the clicked picture. If the user clicks on the large display picture, JS event handling will render a modal box that will pop up in front with a register form for lift tickets and price information about the selected ski resort image.
